

Abstract of the Disclosure

A control system for plumbing equipment includes a user interface and a main controller. Only the user interface is customized and unique to a specific model of the plumbing equipment, and stores main software program that is tailored to operate the particular components of that specific model. The main controller is generic and is able to be used on several different models of the plumbing equipment. Upon activation of the control system the main software program is transferred to the main controller which configures the main controller to operate the specific model of the plumbing equipment.
